Cyber Security : System Adminstration and Hardware Basics

Day 2

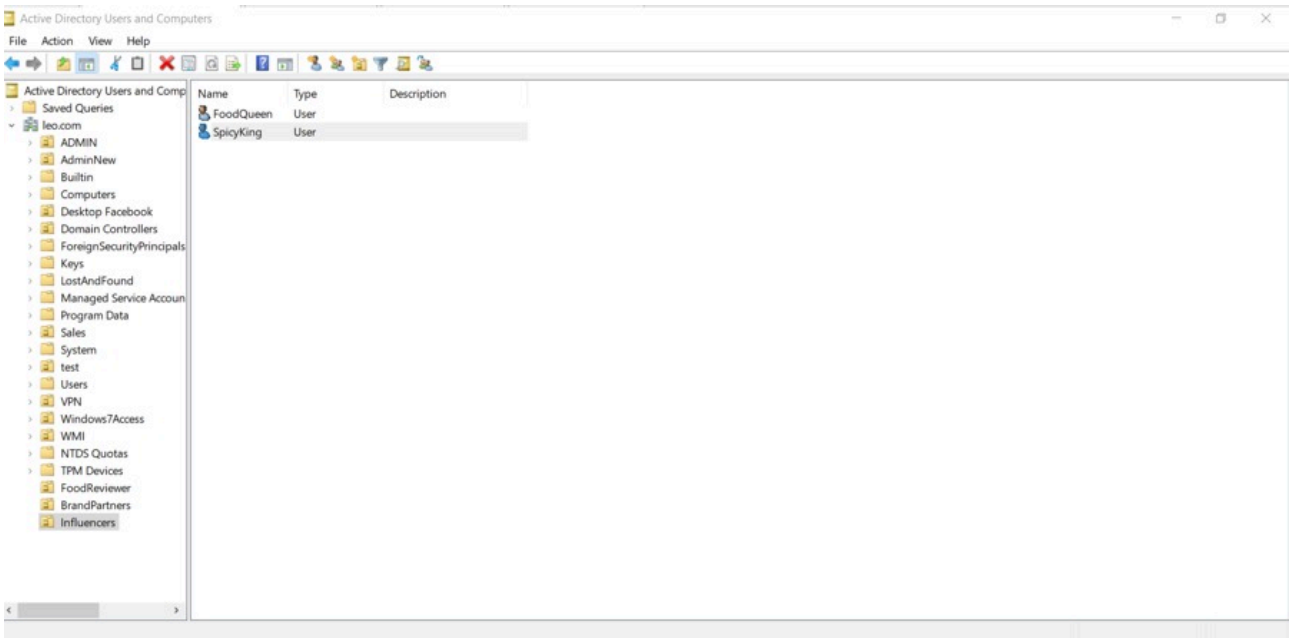

Task 1

Task 2 & 3

Task 4

Day 5

Organizational Units (OUs) are containers within Active Directory that let a company group users, computers, and groups by department, location, or role, instead of managing each account one by one. A company like Zomato or Swiggy could create OUs by function (Engineering, Customer Support, Finance, Delivery Operations) or by city, so a new hire in Bengaluru support is placed in the right OU and instantly inherits the correct Group Policies, such as which apps they can open, which drives they can reach, and what security settings apply. Admins can also delegate control, letting a regional manager reset passwords for their own team without getting full domain admin rights. This keeps access consistent and least-privilege by default, and when someone changes roles or leaves, moving or disabling their account in one OU updates their permissions immediately.
